

webhoster2.0

This application is generated using [LoopBack 4 CLI](#) with the [initial project layout](#).

Install dependencies

By default, dependencies were installed when this application was generated. Whenever dependencies in `package.json` are changed, run the following command:

```
npm install
```

To only install resolved dependencies in `package-lock.json`:

```
npm ci
```

Run the application

```
npm start
```

You can also run `node .` to skip the build step.

Open <http://127.0.0.1:3000> in your browser.

Rebuild the project

To incrementally build the project:

```
npm run build
```

To force a full build by cleaning up cached artifacts:

```
npm run rebuild
```

Fix code style and formatting issues

```
npm run lint
```

To automatically fix such issues:

```
npm run lint:fix
```

Other useful commands

- `npm run migrate` : Migrate database schemas for models
- `npm run openapi-spec` : Generate OpenAPI spec into a file
- `npm run docker:build` : Build a Docker image for this application
- `npm run docker:run` : Run this application inside a Docker container

Tests

```
npm test
```

Optional

Docker:

Do a docker pull of the images:

Mysql:

```
docker pull inf23dwg21/webhoster1.0:mysql5.7
```

NodeJS APP:

```
docker pull inf23dwg21/webhoster1.0:node20
```

What's next

Please check out [LoopBack 4 documentation](#) to understand how you can continue to add features to this application.
